

Web Design Portfolio

Introduction:

Full Stack Developer

Justin Paelmo

I am a huge nerd about web development, tooling, CI/CD, and server administration.

I do my best when working with tight knit teams on finding elegant solutions for any full stack deployment. Here's a small presentation of the work I've done

Development **Philosophy:** Engaging with Users without headaches

About Me: Web Developer Enthusiast

Hello! I'm Justin! I've been a web developer for 17 years. I've worked with clients across a wide array of industries: yachting, medical, clothing, credit unions/banking, finance, aerospace, and more.

I'm deeply passionate about the web development world and making things as easy as possible for my clients so that they can spend their time doing what they do best, working with **their** clients.

Craft CMS
Strapi

Project: Meridian Consulting Partners

Project: Meridian CP

Integrate [Algolia Search](#) components throughout the site. This included leveraging the Algolia Insights API in the backend through Laravel middleware, and through the front end with vanilla [JavaScript](#) and [AlpineJS](#) to give the client a full breadth of analytic information.

I'm particularly proud of the implementation of Middleware I wrote for this because it allowed us to run tracking execution when the server itself was being requested [Craft CMS](#) specific data.

Project: American Elevator Group

Hello, how
can we help
you today?

Let's talk about you

My name is:

I am

Project: American Elevator Group

Built in [CraftCMS](#) I was tasked to build a very unique Customer Introduction UX experience. When landing on the home page users are prompted to fill out a short form. Upon completing this form they are sent to a dynamic landing page that renders content based upon a set of Stories provided by the client. Each of the cards on this landing page are specifically geared towards each of the possible outcomes of the homepage form.

Project: Fabian Group

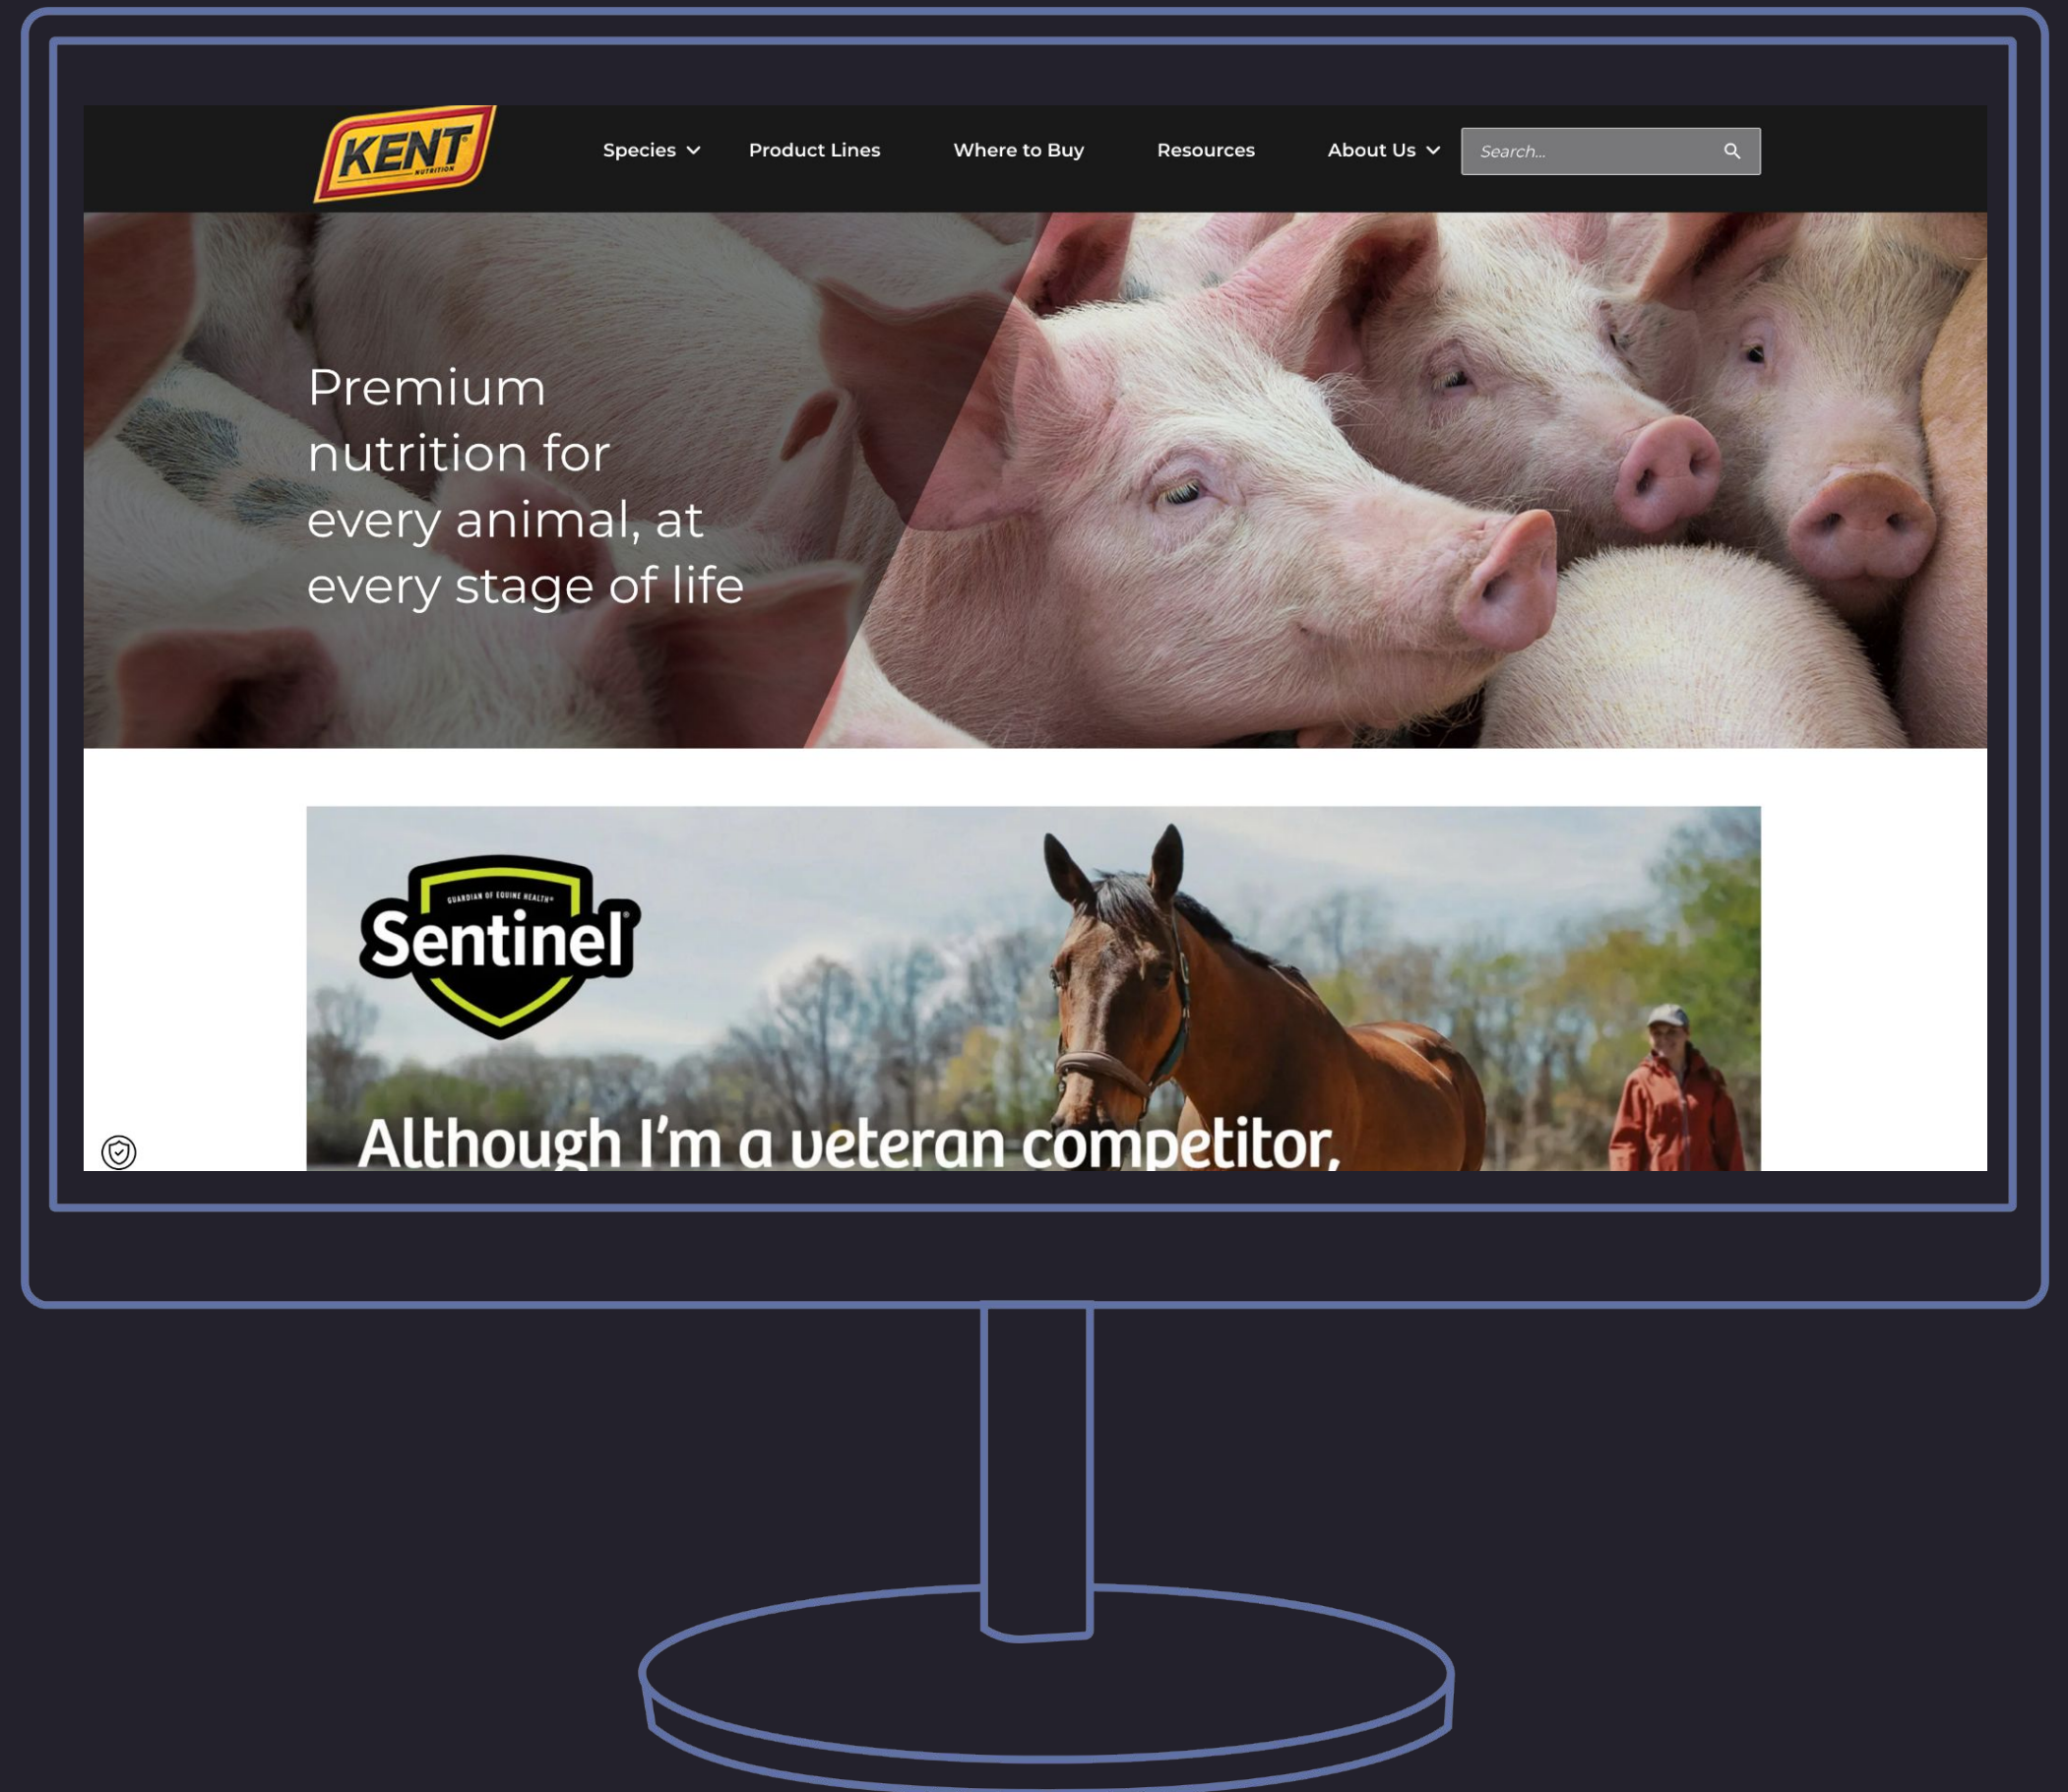

Project: Fabian Group

Fabian Group needed a refactor of three separate brands that fell under their corporate umbrella. The primary goal was to combine the three separate designs into a single **Shopify** store, allowing their end users to purchase products from all three brands in a single shopping cart.

Secondary goal to import every product from each of the brands with their Variant Options adjusted to work off of global option choices (such as color and size). Colors were particularly a challenging option to work with as they were previously handled via hard coded string variables and extracting color values from those strings.

Project: Kent Feeds

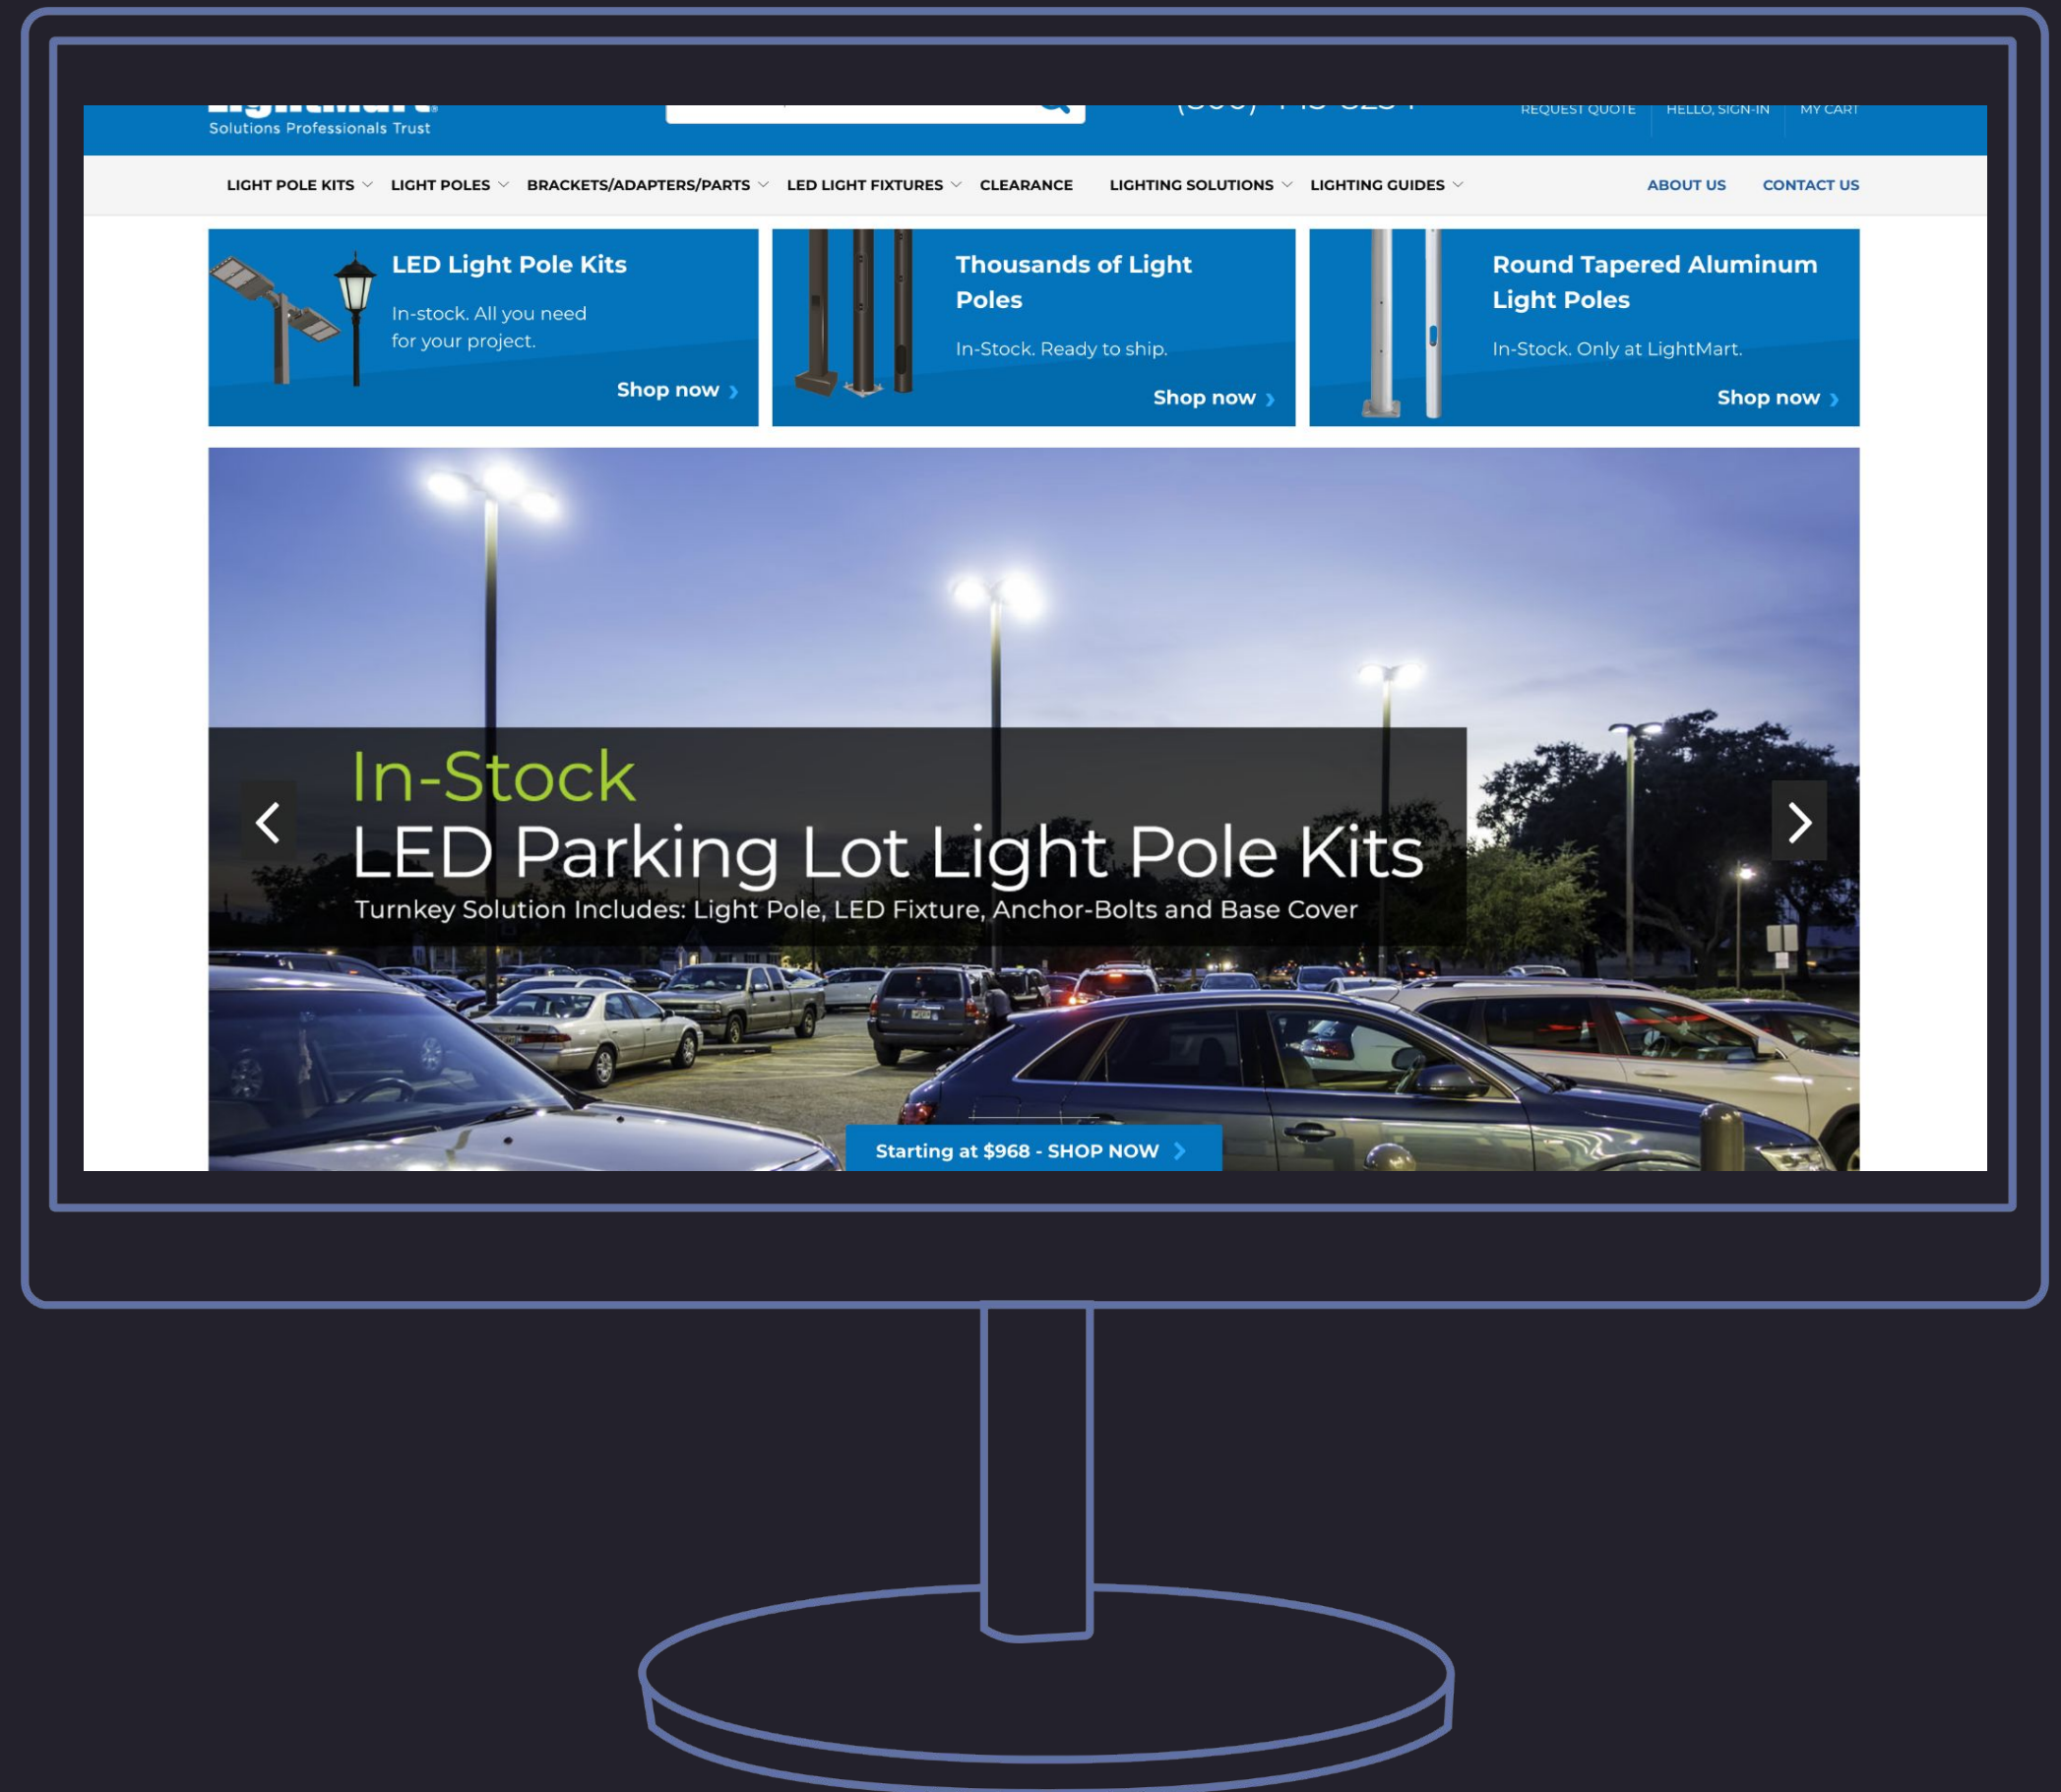

Project: Kent Feeds

Kent Feeds had a [Shopify](#) store already in production, but I was subcontracted out to help develop and fix components for one of their brands: [Native Dog Foods](#).

There were several components that required refactoring to allow the client to manage content through the [Shopify CMS](#) itself, rather than the content being hard coded.

Project: Lightmart

Project: Lightmart

Lightmart was built on the BigCommerce platform to as a b2b vendor for lighting related products.

I was involved with the project as a Full Stack engineer managing everything from the BigCommerce backend to front end deployment, product management and customization of components.

Project: USA Vein Clinics

Project: USA Vein Clinics

Take over and manage deployments and front end development and maintenance of the entire suite of **USA Vein Clinics** websites.

During testing I found that the previous developers had completely missed the mark on a **Period Tracking calendar application** on their website. To rectify this we refactored the component to fix all of the math and provide accurate results for the clients end user

Why We Should Work Together

Technology is important. The internet is practically a utility at this point. Yet as fast paced as the world is, people often feel a little left by the wayside. I've spent my whole life enamored with web development, server administration, and computing hardware.

I pride myself on being able to understand these technologies and communicate with clients about realistic and practical ways they can be used. It's always my goal to work with my clients for success. Not just my own success, but theirs. I'm committed to this for the simple idea that I want people to do what they love best. So let me do what I love best, which is working with technology.
